-:- SUBUNIT: Heterodimer of an alpha chain and a beta chain (beta-2-microglobulin).
-:- SUBCELLULA: COATION: Type I membrane protein.
-:- POLYMORPHISM: The following alleles of B-42 are known: B*4201 (Bw-42) and B*4202. The sequence shown is that of B*4201.
                                                                                    1B42_HUMAN STANDARD; PRT; 362 AA.

HLA class I histocompatibility antigen, B-37 alpha chain precursor (MHC class I antigen B*37).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              microglobulin).
--- SUBCELLULAR LOCATION: Type I membrane protein.
--- POLYMORPHISM: The following alleles of B-37 are known: B*3701,
B*3704 and B*3705. The sequence shown is that of B*3701.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel cancer cell-specific HLA-F antigen useful for diagnosing cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA831081-ABA83180, ABA831812, ABA83180, ABA83181 and ABA83184) or segments thereof (MBA83123-ABA83180, ABA83181 and ABA83181). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer and in tests for monitoring disease status in a patient being treaded for ovarian cancer. The methods can additionally be used to identify a particular tumour as being an ovarian tumour (1.e., an epithelial ovarian tumour selected from serous cystadenoma, borderline serous tumour, serous cystadenoma,

mucinous cystadenoma, borderline mucinous tumour, mucinous cystadenoma, endometrioid carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, cystadenofibroma, adenofibroma and Brenner tumour. The ovarian tumour marker genes of the invention were identified using SAGE (serial analysis of gene expression) and were found to be everexpressed in a broad variety of ovarian epithelial tumour cells relative to normal ovarian epithelial cells. The marker genes are implicated in immune response pathways, in the regulation of cell proliferation and in protein folding, and many of these are membrane-localised or secreted. In addition to their use as diagnostic and prognostic markers, the ovarian tumour marker genes or their encoded proteins may be used as therapeutic targets for the treatment and protein of ovarian cancer. Sequences ABBSO257-ABBSO29 represent proteins encoded by ovarian tumour marker genes of the invention
                                                                                                                                                                                                                                                                                                                                                                               60

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cotivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food pupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful artivity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and coil sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the prin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                510
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; cancer associated gene; cancer antigen; detection; cancer; diagnosis; cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiaschmatic; antirhemutic; antiarthritic; antiviral; entidiammatory; antithyroid; antiallergic; antibacterial; cardiant; dermatological; neuroprotective; thrombolytic; coaquiant; nootropic; vasotropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoletic cell disorder; autoimmune disorder;

The proteins can have activities based on the tissues and calls the genes are expressed in. Example of activities crissues and calls the genes are expressed in. Example of activities includes cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antidiametory; antithyroid; antishlergic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coaqulant; noctropic; vasorropic; antipaciatic and antiangiogenic. The mortropic; vasorropic; antipaciatic and antiangiogenic. The mortropic; vasorropic; antipaciatic and antiangiogenic. The present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, antiomatic cills, to treat disorders of haematopoietic cells, antiomatic cells, antiomatic cells, and organ rejection, modulate haemostatic or thrombolytic activity, modulate inferential infections. The peptides, mucleotides and organ dantagonists and antagonists may be also be used in the exemplification of the acceptance of the control of the acceptance of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

genomic DNAs that

Duclert A, Giordano J;

99US-0122487P

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA primed cDNA libraries. Such ESTs are not well suited for isolating cDNA included. S' ESTs are derived from mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cONAs and genomic DNAs. S' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors ö 1 GSHSLRYFSTAVSRPGRGEPRYIAVEYVDDTQFLRFDSDAAIPRMEPRREPWVEQEGPQYW 60 81 22 GSHSLRYFSTAVSRPGRGEPRYIAVEYVDDTQFLRFDSDAAIPRMEPREPWVEQEGPQYW 0; Gaps 36.1%; Score 99; DB 3; Length 120; 100.0%; Pred. Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases.

Claim 11; SEQ ID NO 4063; 2922pp; English

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABG54131-ABG56305), and also encompasses polypeptides 90% identical and polymucleotides 95% identical comprising human ovarian antigens to the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polymucleotides, antibodies against human ovarian antigens and the use of ovarian antigens prognosing or preventing various ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and catestic tunours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders origin, reproductive system disorders (e.g., infertility, disorders origin, reproductive system cisorders, infertility, disorders origin, reproductive system disorders (e.g., chlamydia, HIV, toxoplammensia, endocrine cisoporystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine cisoporystic ovary syndrome, inflammatory conditions (e.g., mastitis, oophoritis and cysintis), immune disorders (e.g., congenital and acquired to adjoorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypeptides and material material disorders, gastrointestinal disorders and urinary system disorders. Ovarian antigen polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used as therefore madiatives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did neternoric format directly from MIPO cert fire specification, but was obtained in electronic formet directly from WIPO cert fire the printed and the control

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AAB58106 - AAB5848. Lung cancer associated proteins and polymucleotide sequences, their agnists, and antegonists may have neuroprotective; cytostatic; cardioactive; and cantendation in the reaction of the protective; cytostatic; cardioactive; and golymucleotide sequences, their agreeological; or antibacterial cativity. The invention also includes antibodies specific for the protein or polymucleotide sequences. The lung cancer associated polymucleotide cor polymucleotide sequences. The lung cancer associated polymucleotide cor polymucleotide sequences. The protein or numerous other diagnostic or research purposes. The proteins may be used to treat disorders such as certaiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases.

Sequences and proliferative disorders. The proteins may also be used in the course of the invention for the identification and characterisation of the polymucleotide and protein sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The concensus sequence is derived from a total of 23 HLA-A,B,C sequences. The protein sequences in the three extrecellular domains (alpha-1, alpha-2 and alpha-3) are shown. The example concerned the effect of peptides from different HLA-A2 epitopes on cytolysis of target cells by CTL of different specificities. (Updated on 25-WAR-2003 to correct PF field.) (Updated on 25-WAR-2003 to correct PR field.)

polypeptides - isolated products for the

```
Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                  The invention relates to a method for disgnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by an uncleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast and encoded.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, cytokine; cell proliferation; cell differentiation, gene therapy; vaccine; peptide therapy, stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 20; SEQ ID NO 26965; 1399pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                      Probes comprising part of the DNA sequence encoding the protein can be used to identify Class I genes. The DNA can be expressed for immunisation of animals and prodn. of monoclonal antibodies specific for the HLA-C antigen. See also AAR12455 (same patent) and U03112486 and J03112487.                                    t
The invention relates to human polynucleotides (AAI79941-AAI99841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynebtides are useful in gene therspy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, itssue growth factor activity, immunomodilatory activity and activity, inmunomodilatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence date for this patent aid not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell

Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.

-!- FUNCTION: Involved in the presentation of foreign antigens to the immune system.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- POLYMORPHISM: The following alleles of A-24 are known: A*2401, A*2402.

-!- POLYMORPHISM: The following alleles of A-24 are known: A*2401, A*2402.

A*2402, A*2403, A*2408, A*2408, Allele A*2413 are found in the Australian Aborigenal population. Allele A*2413 are found in individuals of South American descent. The sequence shown is that
